Question 1

Correct

Marked out of 5.00

Write a program to find whether the given input number is Odd.

If the given number is odd, the program should return 2 else It should return 1.

Note: The number passed to the program can either be negative. positive or zero. Zero should NOT be treated as Odd.

For example:

In p ut	Re sul t
12	2
3	
4	1
5	
6	

Answer: (penalty regime: 0 %)

```
1 import java.io.*;  
import java.util.*;
```

```
2
```

```

3 public class Odd{
4 public static void main(String[] args)
5 {
6 Scanner sc=new Scanner(System.in);
7 int a=sc.nextInt();
8 if(a%2==1 || a%2== -1)
9 {
10 System.out.println(2);
11 }
12 else if(a%2==0)
13 {
14 System.out.println(1);
15 }
16 else if(a==0)
17 {
18 System.out.println(1);
19 }
20 }
21 }

```

✓	45 6	1	1	✓

Passed all tests! ✓

Write a program that returns the last digit of the given number. Last digit is being referred to the least significant digit i.e. the digit in the ones (units) place in the given number.

The last digit should be returned as a positive number. For example,

if the given number is

197, the last digit is 7 if

the given number is - 197,

the last digit is 7 For

example:

In p ut	Re sul t
19 7	7
- 1 9 7	7

Answer: (penalty regime: 0 %)

```
1 import java.io.*;  
import java.util.*;
```

3

```
import java.math.*;
4 public class Last{
5 public static void main(String[] args)
6 {
er sc=new Scanner(System.in);
sc.nextInt();
th.abs(a);
m.out.println(a% 10);
11}
12 }
```

	Input	Expected	Got	
✓	197	7	7	✓
✓	-197	7	7	✓

Passed all tests! ✓

Question 3

Correct

Marked out of 5.00

Rohit wants to add the last digits of two given numbers. For example, If the given numbers are 267 and 154, the output should be 11. Below is the explanation:
Last digit of

the 267 is 7

Last digit of

the 154 is 4

Sum of 7

and 4 = 11

Write a program to help Rohit achieve this

for any given two numbers. Note: The sign

of the input numbers should be ignored.

i.e.

if the input numbers are 267 and 154, the sum of

last two digits should be 11 if the input numbers

are 267 and - 154, the sum of last two digits

should be 11 if the input numbers are - 267 and

154, the sum of last two digits should be 11 if

the input numbers are - 267 and - 154, the sum

of last two digits should be 11

For example:

In p ut	Re sul t
2 6 7 15 4	11
2 6 7 - 1 5 4	11
- 2 6 7 15 4	11
- 2 6 7	11

Question 3

Correct

Marked out of 5.00

Consider the following sequence:

1st term: 1

2nd term: 1 2 1

3rd term: 1 2 1 3 1 2 1

4th term: 1 2 1 3 1 2 1 4 1 2 1 3 1 2 1

And so on. Write a program that takes as parameter an integer n and prints the nth terms of this sequence. Example Input:

1

Output:

1

Example Input:

4

Output:

1 2 1 3 1 2 1 4 1 2 1 3 1 2 1

For example:

In p ut	Result
1	1
2	1 2 1
3	1 2 1 3 1 2 1
4	1 2 1 3 1 2 1 4 1 2 1 3 1 2 1

Answer: (penalty regime: 0 %)

```
1 import java.io.*;
```

2

```
import java.util.*;
3 public class pattern{
4 public static void main(String[] args)
5 {
    Scanner sc=new Scanner(System.in);
    sc.nextInt();
    res="1";
    for(i=1;i<n;i++)
    10 {
    11 res+=" "+(i+1)+" "+res;
    12 }
    13 System.out.println(res);
    14 }
    15 }

Completed Sunday, 22 September 2024, 9:43 PM

Duration 1 hour 9 mins

Question 1

Correct

Marked out of 5.00

You are provided with a set of numbers (array of numbers).

You have to generate the sum of specific numbers based on its position in the array set provided to you. This is explained below:

Example 1:

Let us assume the encoded set of numbers given to you is:

input1:5 and input2: {1, 51, 436, 7860, 41236}

Step 1:

Starting from the 0th index of the array pick up digits as per below:

0th index – pick up the units value of

the number (in this case is 1). 1st index -

pick up the tens value of the number (in this case it is 5).

2nd index - pick up the hundreds value of the number (in this case it is 4). 3rd index - pick up the thousands value of the number (in this case it is 7).

4th index - pick up the ten thousands value of the number (in this case it is 4). (Continue this for all the elements of the input array).

The array generated from Step 1 will then be – {1, 5, 4, 7, 4}.

Step 2:

Square each number present in the array generated in Step 1.

{1, 25, 16, 49, 16}

Step 3:

Calculate the sum of all elements of the array generated in Step 2 to get the final result. The result will be = 107. Note:

- 1) While picking up a number in Step1, if you observe that the number is smaller than the required position then use 0.
- 2) In the given function, input1[] is the array of numbers and input2 represents the number of elements in input1. Example 2:

input1: 5 and input1: {1, 5, 423, 310, 61540}

Step 1:

Generating the new array based on position, we get the below array:

{1, 0, 4, 0, 6}

In this case, the value in input1 at index 1 and 3 is less than the value required to be picked up based on position, so we use a 0. Step 2:

{1, 0, 16, 0, 36}

Step 3:

The final result = 53.

For example:

Input	Result
5 1 51 436 7860 41236	107
5 1 5 423 310 61540	53

Answer: (penalty regime: 0 %)

```

1 import
  java.io.*;
  import
  java.util.*;
2 public class arraysp{
  public static void main(String[] args)
3  {
    Scanner sc=new Scanner(System.in);
4
5
6

```

7			int sum=0;
8			int n=sc.nextInt();
9			int[] arr=new int[n];
10			for(int i=0;i<n;i++)
11			{
12			arr[i]=sc.nextInt();
13			}

1 4			<code>int[] p=new int[n];</code>
1 5			<code>for(int i=0;i<n;i++)</code>
1 6			<code>{</code>
1 7			<code>p[i]=(arr[i]/(int)</code> <code>Math.pow(10,i)) % 10;</code>
1 8			<code>}</code>
1 9			<code>for(int i:p)</code>
2 0			<code>{</code>
2 1			<code>sum+=i*i;</code>
2 2			<code>}</code>

Question 2

Correct

Marked out of 5.00

Given an integer array as input, perform the following operations on the array, in the below specified sequence.

1. Find the maximum number in the array.
2. Subtract the maximum number from each element of the array.
3. Multiply the maximum number (found in step 1) to each element of the resultant array. After the operations are done, return the resultant array.

Example 1:

input1 = 4 (represents the number of elements in the input1 array) input2 = {1, 5, 6, 9}

Expected Output =
{- 72, - 36, 27, 0}

Explanation:

Step 1: The maximum number in the given array is 9.

Step 2: Subtracting the maximum number 9 from each element of the array:

$\{(1 - 9), (5 - 9), (6 - 9), (9 - 9)\} = \{-8, -4, -3, 0\}$

Step 3: Multiplying the maximum number 9 to each of the resultant array:

$\{(-8 \times 9), (-4 \times 9), (3 \times 9), (0 \times 9)\} = \{-72, -36, -27, 0\}$

So, the expected output is the resultant array {- 72, - 36, - 27, 0}.

Example 2:

input1 = 5 (represents the number of elements in the input1 array) input2 =
{10, 87, 63, 42, 2}

Expected Output = {- 6699, 0, - 2088, - 3915, - 7395}

Explanation:

Step 1: The maximum number in the given array is 87.

Step 2: Subtracting the maximum number 87 from each element of the array:

$\{(10 - 87), (87 - 87), (63 - 87), (42 - 87), (2 - 87)\} = \{-77, 0, -24, -45, -85\}$

Step 3: Multiplying the maximum number 87 to each of the resultant array:

$\{(-77 \times 87), (0 \times 87), (-24 \times 87), (-45 \times 87), (-85 \times 87)\} = \{-6699, 0, -2088, -3915, -7395\}$

So, the expected output is the resultant array $\{-6699, 0, -2088, -3915, -7395\}$.

Example 3:

input1 = 2 (represents the number of elements in the input1 array) input2 =

$\{-9, 9\}$

Expected Output = $\{-162, 0\}$

Explanation:

Step 1: The maximum number in the given array is 9.

Step 2: Subtracting the maximum number 9 from each element of the array:

$\{(-9 - 9), (9 - 9)\} = \{-18, 0\}$

Step 3: Multiplying the maximum number 9 to each of the resultant array:

$\{(-18 \times 9), (0 \times 9)\} = \{-162, 0\}$

So, the expected output is the resultant array $\{-162, 0\}$.

Note: The input array will contain not more than 100 elements

For example:

Input	Result
4 1 5 6 9	- 72 - 36 - 27 0

Input	Result
5 10 87 63 42 2	- 6699 0 - 2088 - 3915 - 7395
2 - 9 9	- 162 0

Question 3

Correct

Marked out of 5.00

Given an array of numbers, you are expected to return the sum of the longest sequence of POSITIVE numbers in the array. If there are NO positive numbers in the array, you are expected to return - 1.

In this question's scope, the number 0 should be considered as positive.

Note: If there are more than one group of elements in the array having the longest sequence of POSITIVE numbers, you are expected to return the total sum of all those POSITIVE numbers (see example 3 below).

input1 represents the number of elements in the array. input2 represents the array of integers.

Example 1:

input1 = 16

input2 = {- 12, - 16, 12, 18, 18, 14, - 4, - 12, - 13, 32, 34, - 5, 66, 78, 78, - 79}

Expected

output = 62

Explanation:

The input array contains four sequences of POSITIVE numbers, i.e. "12, 18, 18, 14", "12", "32, 34", and "66, 78, 78". The first sequence "12, 18, 18, 14" is the longest of the four as it contains 4 elements. Therefore, the expected output = sum of the longest sequence of POSITIVE numbers = 12 + 18 + 18 + 14 = 63.

Example 2:

input1 = 11

input2 = {- 22, - 24, 16, - 1, - 17, - 19, - 37, - 25, - 19, - 93, - 61}

Expected

output = - 1

Explanation:

There are NO positive numbers in the input array. Therefore, the

expected output for such cases = - 1. Example 3:

input1 = 16

input2 = {- 58, 32, 26, 92, - 10, - 4, 12, 0, 12, - 2, 4, 32, - 9, - 7, 78, - 79}

Expected

output =

174

Explanation:

The input array contains four sequences of POSITIVE numbers, i.e. "32, 26, 92", "12, 0, 12", "4, 32", and "78". The first and second sequences "32, 26, 92" and "12, 0, 12" are the longest of the four as they contain 4 elements each. Therefore, the expected output = sum of the longest sequence of POSITIVE numbers = (32 + 26 + 92) + (12 + 0 + 12) = 174.

For example:

Input	Result
16 - 12 - 16 12 18 18 14 - 4 - 12 - 13 32 34 - 5 66 78 78 - 79	62
11 - 22 - 24 - 16 - 1 - 17 - 19 - 37 - 25 - 19 - 93 - 61	- 1

Question 1

Correct

Marked out of 5.00

Create a class Student with two private attributes, name and roll number. Create three objects by invoking different constructors available in the class Student.

Student()

Student(String

name)

Student(String name, int rollno)

Input:

No input

Output:

No- arg constructor is invoked

1 arg constructor is invoked

2 arg

constructor is

invoked Name

=null , Roll no

= 0

Name

=Rajalakshmi , Roll

no = 0 Name

=Lakshmi , Roll no

= 101

For example:

T	Result
---	--------

e s t	
1	No- arg constructor is invoked 1 arg constructor is invoked 2 arg constructor is invoked Name =null , Roll no = 0 Name =Rajalakshmi , Roll no = 0 Name =Lakshmi , Roll no = 101

Answer: (penalty regime: 0 %)

```

1 public class Student{
    private String
    name; private
    int rollno; public
2 Student()
    {

Question 2

Correct

Marked out of 5.00

Create a Class Mobile with the attributes listed below, private String manufacturer;
private String operating_system;
public String color;
private int cost;

Define a Parameterized constructor to initialize the above instance variables. Define getter and setter methods for the attributes above.

for example : setter method

for manufacturer is void

```
setManufacturer(String  
manufacturer)
```

```
{ this.manufacturer=  
manufacturer;  
}
```

String

```
getManufactu
```

```
rer(){ return  
manufacturer;  
}
```

Display the object details by overriding the toString() method.

For example:

T e s t	Result
1	manufacturer = Redmi operating_syste m = Andriod color = Blue cost = 34000

Question 3

Correct

Marked out of 5.00

Create a class called "Circle" with a radius attribute. You can access and modify this attribute using getter and setter methods. Calculate the area and circumference of the circle.

Area of

Circle =

πr^2

Circumference =

$2\pi r$

Input:

2

Output:

Area = 12.57

Circumference =

25.13

example:

Test	Input	Result
1	4	Area = 50.27 Circumference = 25.13

Answer: (penalty regime: 0 %)

Reset answer	
1	<code>import java.io.*;</code>
2	<code>import java.util.*;</code>
3	<code>class Circle</code>
4	<code>{</code>
5	<code>private double radius;</code>

6	<code>public Circle(double radius){</code>

Question 1

Correct

Marked out of 5.00

Create a class known as "BankAccount" with methods called deposit() and withdraw().

Create a subclass called SavingsAccount that overrides the withdraw() method to prevent withdrawals if the account balance falls below one hundred.

For example:

Result
Create a Bank Account object (A/c No. BA1234) with initial balance of \$500: Deposit \$1000 into account BA1234: New balance after depositing \$1000: \$1500.0 Withdraw \$600 from account BA1234: New balance after withdrawing \$600: \$900.0

Answer: (penalty regime: 0 %)

Reset answer	
1	<code>class BankAccount {</code>
2	<code> private String accountNumber;</code>
3	<code> private double balance;</code>
4	
5	<code> public BankAccount(String accountNumber, double initialBalance) {</code>
6	<code> this.accountNumber = accountNumber;</code>
7	<code> this.balance = initialBalance;</code>
8	<code> }</code>
9	
10	<code> public void deposit(double amount) {</code>
1 1	<code> balance += amount;</code>
1 2	<code> // Format the output correctly</code>
1 3	<code> System.out.println("New balance after depositing \$" + (amount % 1 == 0 ? String.format("%.0f", amount) : Strin</code>
1 4	<code> }</code>

1 5	
1 6	
17	<code>public void withdraw(double amount) {</code>
18	<code> if (balance >= amount) {</code>
1 9	<code> balance -= amount;</code>
2 0	<code> // Format the output correctly</code>
2 1	<code> System.out.println("New balance after withdrawing \$" + (amount % 1 ==</code>
22	<code>0 ? String.format("%.0f", amount</code>
	<code>) else {</code>
2 3	<code> System.out.println("Insufficient funds!");</code>
2 4	<code> }</code>
2 5	<code>}</code>
2 6	
27	<code>public double getBalance() {</code>
2 8	<code> return balance;</code>
2 9	<code>}</code>
3 0	<code>}</code>
3 1	
32	<code>class SavingsAccount extends BankAccount {</code>
3 3	<code> private final double minimumBalance = 100.0;</code>

3 4	
35	<code>public SavingsAccount(String accountNumber, double initialBalance) {</code>

Question 1

Correct

Marked out of 5.00

Given a String input1, which contains many number of words separated by : and each word contains exactly two lower case alphabets, generate an output based upon the below 2 cases.

Note:

1. All the characters in input 1 are lowercase alphabets.
2. input 1 will always contain more than one word separated by :
3. Output should be returned in uppercase.

Case 1:

Check whether the two alphabets are same.

If yes, then take one alphabet from it

and add it to the output. Example 1:

input1 =

ww:ii:pp:rr:

oo output =

WIPRO

Explanation:

word1 is ww, both are

same hence take w

word2 is ii, both are

same hence take i word3

is pp, both are same

hence take p word4 is rr,

both are same hence

take r word5 is oo, both

are same hence take o

Hence the output is

WIPRO

Case 2:

If the two alphabets are not same, then find the position value of them and find maximum value – minimum value. Take the alphabet which

comes at this (maximum value - minimum value) position in the alphabet series.

Exempl

e 2"

input1 =

zx:za:ee

output

= BYE

Explanat

ion

word1 is zx, both are not same alphabets position

value of z is 26

position value of x is 24

max - min will be $26 - 24 = 2$

Alphabet which comes

in 2nd position is b

Word2 is za, both are

not same alphabets

position value of z is 26

position value of a is 1

max - min will be $26 - 1 = 25$

Alphabet which comes in

25th position is y word3 is

ee, both are same hence

take e Hence the output

is BYE

For example:

Input	Re sul t
ww:ii:pp :rr:oo	W I P R O
zx:za:ee	BY E

Answer: (penalty regime: 0 %)

1	<code>import java.util.Scanner;</code>

Question 2

Correct

Marked out of 5.00

Given 2 strings input1 & input2.

- Concatenate both the strings.
- Remove duplicate alphabets & white spaces.
- Arrange the alphabets in descending order.

Assumption 1:

There will either be alphabets, white spaces

or null in both the inputs. Assumption 2:

Both inputs will be in

lower case.

Example 1:

Input 1: apple

Input 2:

orange

Output:

rponlgea

Example

2:

Input 1:

fruits

Input 2:

are good

Output:

utsroigfeda

Example 3:

Input 1: ""

Input 2:

""

Output:

null

For example:

T e s t	Inpu t	Result
1	apple orange	rponl gea
2	fruit s are goo d	utsroi gfeda

Question 3

Correct

Marked out of 5.00

You are provided a string of words and a 2- digit number. The two digits of the number represent the two words that are to be processed. For example:

If the string is "Today is a Nice Day" and the 2- digit number is 41, then you are expected to process the 4th word ("Nice") and the 1st word ("Today").

The processing of each word is to be done as follows:

Extract the Middle- to- Begin part: Starting from the middle of the word, extract the characters till the beginning of the word. Extract the Middle- to- End part:

Starting from the middle of the word, extract the characters till the end of the word.

If the word to be processed is "Nice":

Its Middle- to- Begin

part will be "iN". Its

Middle- to- End part

will be "ce".

So, merged together these two

parts would form "iNce".

Similarly, if the word to be

processed is "Today":

Its Middle- to- Begin

part will be "doT". Its

Middle- to- End part

will be "day".

So, merged together these two parts would form "doTday".

Note: Note that the middle letter 'd' is part of both the extracted parts. So, for words whose length is odd, the middle letter should be included in both the extracted parts.

Expected output:

The expected output is a string containing both the processed

words separated by a space "iNce doTday" Example 1:

input1 = "Today is a

Nice Day" input2 =

41

output = "iNce

doTday"

Example 2:

input1 = "Fruits like Mango and Apple are

common but Grapes are rare" input2 = 39

output = "naMngo arGpes"

Note: The input string input1 will contain only alphabets and a single space character separating each word in the string. Note: The input string input1 will NOT contain any other special characters.

Note: The input number input2 will always be a 2- digit number (≥ 11 and ≤ 99). One of its digits will never be 0. Both the digits of the number will always point to a valid word in the input1 string.

For example:

Input	Result
Today is a Nice Day 41	iNce doTday
Fruits like Mango and Apple are common but Grapes are rare 39	naMng o arGpes

Answer: (penalty regime: 0 %)

1	<code>import java.util.Scanner;</code>
2	
3	<code>public class WordProcessor {</code>
4	<code>public static void main(String[] args) {</code>
5	<code>Scanner sc = new Scanner(System.in);</code>
6	
7	<code>String input = sc.nextLine();</code>

8	<code>int number = sc.nextInt();</code>
9	<code>String[] words = input.split(" ");</code>
1 0	

1 1	<code>int pos1 = number / 10;</code>
1 2	<code>int pos2 = number % 10;</code>
1 3	
1 4	<code>pos1--;</code>
1 5	<code>pos2--;</code>
1 6	

1 7		<code>String result1 = processWord(words[pos1]);</code>
1 8		<code>String result2 = processWord(words[pos2]);</code>
1 9		
2 0		<code>String result = result1 + " " + result2;</code>
2 1		<code>System.out.println(result);</code>
2 2		<code>}</code>
2 3		
2 4		<code>private static String processWord(String word) {</code>
2 5		<code>int len = word.length();</code>
2 6		<code>int mid = len / 2;</code>
2 7		
2 8		<code>String middleToBegin;</code>
2 9		<code>String middleToEnd;</code>
3 0		
3 1		<code>if (len % 2 == 0)</code>
3 2		<code>{</code>

3 3		middleToBegin = new StringBuilder(word.substring(0, mid)).reverse().toString();
3 4		middleToEnd = word.substring(mid);
3 5		}
3 6		else
3 7		{
3 8		middleToBegin = new StringBuilder(word.substring(0, mid + 1)).reverse().toString();
3 9		middleToEnd = word.substring(mid);
4 0		}
4 1		return middleToBegin + middleToEnd;
4 2		}
4 3	}	

	Input	Expected	Got	
✓	Today is a Nice Day 41	iNce doTday	iNce doTday	✓

Question 1

Correct

Marked out of 5.00

create an interface Playable with a method play() that takes no arguments and returns void. Create three classes Football, Volleyball, and Basketball that implement the Playable interface and override the play() method to play the respective sports.

```
interface
    Playable
    { void
    play();
    }
class Football
    implements
    Playable { String
    name;
    public
    Football(String
    name)
    { this.name=name
    e;
    }
    public void play() {
    System.out.println(name+" is Playing football");
    }
}
```

Similarly, create Volleyball and Basketball classes.

Sample output:

Sadhvin is Playing
football Sanjay is

For example:

T e s t	Inp ut	Result
1	Sa dh vin Sa nja y Sr uth i	Sadhvin is Playing football Sanjay is Playing volleyball Sruthi is Playing basketball
2	Vij ay Ar un B al aji	Vijay is Playing football Arun is Playing volleyball Balaji is Playing basketball

Answer: (penalty regime: 0 %)

1	<code>import java.util.Scanner;</code>
2	
3	<code>interface Playable</code>
4	<code>{</code>
5	<code>void play();</code>

6	}
7	
8	class Football implements Playable {
9	String name;
10	
11	public Football(String name)
12	{
13	this.name = name;
14	}
15	
16	public void play()
17	{
18	System.out.println(name + " is Playing football");
19	}
20	}
21	
22	class Volleyball implements Playable
23	{
24	String name;
25	

5	
2 6	<code>public Volleyball(String name)</code>
27	<code>{</code>
2 8	<code> this.name = name;</code>
2 9	<code>}</code>
3 0	
3 1	<code>public void play()</code>
32	<code>{</code>
3 3	<code> System.out.println(name + " is Playing volleyball");</code>

```

3  }
4  }
5  class Basketball
38 {
39     String
40     {
41         public Basketball(String name)
42         {
43             this.name = name;
44         }
45     }
46     public void play()
47     {
48         }
49     }
50 }

```

	T e s t	Inp ut	Expected	Got	
✓	1	Sa dh vin	Sadhvin is Playing football Sanjay is Playing volleyball Sruthi	Sadhvin is Playing football Sanjay is Playing volleyball Sruthi	✓

		Sa nja y Sr uth i	is Playing basketball	is Playing basketball	
✓	2	Vij ay Ar un B al aji	Vijay is Playing football Arun is Playing volleyball Balaji is Playing basketball	Vijay is Playing football Arun is Playing volleyball Balaji is Playing basketball	✓

Passed all tests! ✓

Question 2

Correct

Marked out of 5.00

Create interfaces
shown below.
interface Sports {
public void
setHomeTeam(String
name); public void
setVisitingTeam(String
name);

```

}
interface Football
extends Sports { public
void
homeTeamScored(int
points);
public void visitingTeamScored(int points);}
create a class College that implements the Football interface and provides the
necessary functionality to the abstract methods. sample Input:

```

Rajal
aksh
mi
Save
etha
22
21

Output:

Rajalakshmi 22 scored
Saveetha 21
scored
Rajalakshmi
is the Winner!

For example:

T e s t	Input	Result
1	Rajala kshmi Savee tha 22 21	Rajalakshmi 22 scored Saveetha 21 scored Rajalakshmi is the winner!

Answer: (penalty regime: 0 %)

Reset answer	
1	<code>import java.util.Scanner;</code>
2	

3	interface Sports
4	{
5	public void setHomeTeam(String name);
6	public void setVisitingTeam(String name);

Question 3

Correct

Marked out of 5.00

RBI issues all national banks to collect interest on all customer loans.

Create an RBI interface with a variable String parentBank="RBI"

and abstract method rateOfInterest(). RBI interface has two more methods default and static method.

```
default void policyNote() {
```

```
System.out.println("RBI has a new Policy issued in 2023.");
```

```
}
```

```
static void regulations(){
```

```
System.out.println("RBI has updated new regulations on 2024.");
```

```
}
```

Create two subclasses SBI and Karur which

implements the RBI interface. Provide the

necessary code for the abstract method in

two sub- classes. Sample Input/Output:

RBI has a new Policy issued in 2023

RBI has updated new

regulations in 2024. SBI

rate of interest: 7.6 per annum.
Karur rate of interest: 7.4 per annum.
For example:

T e s t	Result
1	RBI has a new Policy issued in 2023 RBI has updated new regulations in 2024. SBI rate of interest: 7.6 per annum. Karur rate of interest: 7.4 per annum.

Answer: (penalty regime: 0 %)

1	<code>interface RBI</code>
2	<code>{</code>
3	<code>String parentBank = "RBI";</code>
4	
5	<code>double rateOfInterest();</code>
6	
7	<code>default void policyNote()</code>
8	<code>{</code>
9	<code>System.out.println("RBI has a new Policy issued in 2023");</code>
10	<code>}</code>
11	
12	<code>static void regulations()</code>
13	<code>{</code>

1 4	System.out.println("RBI has updated new regulations in 2024.");
1 5	}
1 6	}
1 7	
1 8	class SBI implements RBI
19	{
2 0	public double rateOfInterest()
21	{
2 2	return 7.6;
2 3	}
2 4	}
2 5	
2 6	class Karur implements RBI
27	{
2 8	public double rateOfInterest()
29	{
3 0	return 7.4;
3	}

1	
3 2	}
3 3	
3 4	public class test
35	{
3 6	public static void main(String[] args)
37	{

3 8		SBI sbiBank = new SBI();
3 9		Karur karurBank = new Karur();
4 0		
4 1		sbiBank.policyNote();
4 2		RBI.regulations();
4 3		
4 4		System.out.println("SBI rate of interest: " + sbiBank.rateOfInterest() + " per annum.");
4		System.out.println("Karur rate of interest: " +

5			karurBank.rateOfInterest() + " per annum.");
4 6		}	
4 7		}	

	T e s t	Expected	Got	
✓	1	RBI has a new Policy issued in 2023 RBI has updated new regulations in 2024. SBI rate of interest: 7.6 per annum. Karur rate of interest: 7.4 per annum.	RBI has a new Policy issued in 2023 RBI has updated new regulations in 2024. SBI rate of interest: 7.6 per annum. Karur rate of interest: 7.4 per annum.	✓

Question 1

Correct

Marked out of 5.00

1. Final Variable:

- Once a variable is declared **final**, its value cannot be changed after it is initialized.
- It must be initialized when it is declared or in the constructor if it's not initialized at declaration.
- It can be used to define constants

```
final int MAX_SPEED = 120; // Constant value, cannot be changed
```

2. Final Method:

- A method declared **final** cannot be overridden by subclasses.
- It is used to prevent modification of the method's behavior in derived classes.

```
public final void display()  
{ System.out.println("This  
is a final method.");  
}
```

3. Final Class:

- A class declared as **final** cannot be subclassed (i.e., no other class can inherit from it).
- It is used to prevent a class from being extended and modified.
- ```
public final class Vehicle {
 // class code
}
```

Given a Java Program that contains the bug in it, your task is to clear the bug to the output. you should delete any piece of code.

For example:

|   |        |
|---|--------|
| T | Result |
|---|--------|

|             |                                                                             |
|-------------|-----------------------------------------------------------------------------|
| e<br>s<br>t |                                                                             |
| 1           | The maximum speed<br>is: 120 km/h<br>This is a subclass of<br>FinalExample. |

Answer: (penalty regime: 0 %)

|                 |                                                                                 |
|-----------------|---------------------------------------------------------------------------------|
| Reset<br>answer |                                                                                 |
| 1               | <code>class</code> FinalExample {                                               |

Passed all tests! ✓

Question 2

Correct

Marked out of 5.00

Create a base class Shape with a method called calculateArea(). Create three subclasses: Circle, Rectangle, and Triangle. Override the calculateArea() method in each subclass to calculate and return the shape's area.

In the given exercise, here is a simple diagram illustrating polymorphism implementation:

```

abstract class Shape {
 public abstract double calculateArea() ;
}

```

```

System.out.printf("Area of a Triangle :%.2f% n",
((0.5)*base*height)); // use this statement sample

```

Input :

4 // radius of the circle to calculate area  $\pi * r * r$

5 // length of the rectangle

6 // breadth of the rectangle to calculate the area of a rectangle

4 // base of the triangle

3 // height of the triangle

OUTPUT:

Area of a  
circle :50.27

Area of a  
Rectangle  
:30.00 Area of  
a Triangle  
:6.00

For example:

| T<br>e<br>s<br>t | In<br>p<br>u<br>t | Result            |
|------------------|-------------------|-------------------|
| 1                | 4                 | Area of a circle: |

|   |     |                            |
|---|-----|----------------------------|
|   |     | 50.27                      |
|   | 5   | Area of a Rectangle: 30.00 |
|   | 6   | Area of a Triangle: 6.00   |
|   | 4   |                            |
|   | 3   |                            |
| 2 | 7   | Area of a circle: 153.94   |
|   | 4.5 | Area of a Rectangle: 29.25 |
|   | 6.5 | Area of a Triangle: 4.32   |
|   | 2.4 |                            |
|   | 3.6 |                            |

Answer: (penalty regime: 0 %)

|    |                                                          |

### Question 3

Correct

Marked out of 5.00

As a logic building learner you are given the task to extract the string which has vowel as the first and last characters from the given array of Strings.

Step1: Scan through the array of Strings, extract the Strings with first and last characters as vowels; these strings should be concatenated. Step2: Convert the concatenated string to lowercase and return it.

If none of the strings in the array has first and last character as vowel, then return no matches found input1: an integer representing the number of elements in the array.

input2:

String

array.

Example 1:

input1: 3

input2: {" oreo" ,

" sirish" ,  
" apple" } output:

oreoapple

Example 2:

input1: 2

input2:

{" Mango" ,

" banana" }

output: no

matches found

Explanation:

None of the strings has first and last character as vowel.

Hence the output is no  
matches found. Example

3:

input1: 3

input2:

{" Ate" ,

" Ace" ,

" Girl" }

output: ateace

For example:

| Input                     | Result                 |
|---------------------------|------------------------|
| 3<br>oreo sirish<br>apple | oreoappl<br>e          |
| 2<br>Mango<br>banana      | no<br>matches<br>found |
| 3<br>Ate Ace<br>Girl      | ateace                 |

Answer: (penalty regime: 0 %)

Duration 6 mins 17 secs

Question 1

Correct

Marked out of 5.00

In the following program, an array of integer data is to be initialized. During the initialization, if a user enters a value other than an integer, it will throw an InputMismatchException exception. On the occurrence of such an exception, your program should print " You entered bad data."

If there is no such exception it will print the total sum of the array.

/\* Define try- catch block to save user input in the array "name"

If there is an exception then catch the exception otherwise print the total sum of the

array. \*/

Sample Input:

3

5 2 1

Sample Output:

8

Sample Input:

2

1 g

Sample Output:

You entered bad data

For example:

| In<br>p<br>ut    | Result                   |
|------------------|--------------------------|
| 3<br>5<br>2<br>1 | 8                        |
| 2<br>1<br>g      | You entered<br>bad data. |

Answer: (penalty regime: 0 %)

| Reset<br>answer |                                        |
|-----------------|----------------------------------------|
| 1               | <code>import java.util.Scanner;</code> |

2

```
import java.util.InputMismatchException;
3 class prog {
4 public static void main(String[] args) {
5 Scanner sc = new Scanner(System.in);
6 int length = sc.nextInt();
7 int[] name = new int[length];
8 int sum=0;
9 try
10 {
11 for(int i=0;i<length;i++){
12 name[i] = sc.nextInt();
13 sum+=name[i];
14 }
15 System.out.println(sum);
16 }
17 catch(InputMismatchException e)
18 {
19 System.out.println("You entered bad data.");
20 }
21 }
22 }
```

## Question 2

Correct

Marked out of 5.00

Write a Java program to handle `ArithmeticException` and `ArrayIndexOutOfBoundsException`. Create an array, read the input from the user, and store it in the array.

Divide the 0th index element by the 1st

index element and store it. if the 1st

element is zero, it will throw an

exception.

if you try to access an element beyond the array limit throws an exception.

Input:

5

10 0 20 30 40

Output:

`java.lang.ArithmeticExce`

`ption: / by zero I am`

`always executed`

Input:

3

10 20 30

Output

`java.lang.ArrayIndexOutOfBoundsException:`

`Index 3 out of bounds for length 3 I am always executed`

For example:

| T<br>e<br>s<br>t | Input | Result |
|------------------|-------|--------|
|                  |       |        |

|   |              |                                          |
|---|--------------|------------------------------------------|
| 1 | 6            | java.lang.ArithmeticException: / by zero |
|   | 10 4<br>12 8 | I am always executed                     |

Answer: (penalty regime: 0 %)

|    |                                        |
|----|----------------------------------------|
| 1  | import java.util.Scanner;              |
| 2  |                                        |
| 3  | public class I                         |
| 4  | {                                      |
| 5  | public static void main(String[] args) |
| 6  | {                                      |
| 7  | Scanner sc = new Scanner(System.in);   |

Question 3

Correct

Marked out of 5.00

Write a Java program to create a method that

takes an integer as a parameter and throws an exception if the number is odd.

Sample input and Output:

82 is even.

Fill the preloaded answer to get the expected output.

For example:

Result

82 is even.

Answer: (penalty regime: 0 %)

| Reset answer |                                                                       |
|--------------|-----------------------------------------------------------------------|
| 1            | <code>class prog</code>                                               |

Given an ArrayList, the task is to get the first and last element of the ArrayList in Java.

Input: ArrayList = [1, 2, 3, 4]  
Output: First = 1, Last = 4

Approach:

1. Get the ArrayList with elements.
2. Get the first element of ArrayList using the get(index) method by passing index = 0.
3. Get the last element of ArrayList using the get(index) method by passing index = size - 1.

Answer: (penalty regime: 0 %)

The given Java program is based on the ArrayList methods and its usage. The Java

program is partially filled. Your task is to fill in the incomplete statements to get the desired output.

```
list.set();
list.indexO
f());
list.lastInd
exOf())
list.contai
ns()
list.size());
list.add();
list.remov
e();
```

The above methods are used for the below Java program.

### Question 3

Correct

Marked out of 1.00

Write a Java program to reverse elements in an array list.

Sample input and

Output: Red

Green

Orang

e

White

Black

Answer: (penalty regime: 0 %)

```
1 import java.util.*;
 public class ReverseArrayList{
 public static void main(String[] args){
 Scanner scanner=new Scanner(System.in);
2 ArrayList<String>colorList=new
 ArrayList<>(); int
 n=scanner.nextInt();
 scanner.next
3 Line();
 for(int
 i=0;i<n;i++)
 {
```

```
4 String
 color=scanner.nextLine();
5 colorList.add(color);
 }
6 System.out.println("List before
 reversing :");
7 System.out.println(colorList);
 Collections.reverse(colorList);
8 System.out.println("List after
 reversing :");
9 System.out.println(colorList);
 }
 }

Question 1

Correct

Marked out of 1.00

Java HashSet class implements the Set interface, backed by a hash table which is actually a [HashMap](#) instance.

No guarantee is made as to the iteration order of the hash sets which means that the class does not guarantee the constant order of elements over time.

This class permits the null element.

The class also offers constant time performance for the basic operations like add, remove, contains, and size assuming the hash function disperses the elements properly among the buckets.

### Java HashSet Features

A few important features of HashSet are mentioned below:

- Implements [Set Interface](#).
- The underlying data structure for HashSet is [Hashtable](#).
- As it implements the Set Interface, duplicate values are not allowed.
- Objects that you insert in HashSet are not guaranteed to be inserted in the same order. Objects are inserted based on their hash code.
- NULL elements are allowed in HashSet.

public class HashSet<E> extends AbstractSet<E> implements Set<E>, Cloneable, Serializable Sample Input and Output:

5  
90  
56  
45  
78  
25  
78

Sample Output:

78 was found in  
the set. Sample

HashSet also implements Serializable and Cloneable interfaces.

Answer: (penalty regime: 0 %)

## Question 2

Correct

Marked out of 1.00

Write a Java program to compare two sets and retain elements that are the same.

Sample Input and Output:

5

Foo

tball

Hoc

key

Cric

ket

Voll

eyb

all

Bas

ketb

all

7// HashSet 2:

Golf

Cric

ket

Bad

mint

on

Foo

tball

Hoc

key

Voll

eyb

all

Han

dbal

I

SAMPLE OUTPUT:

Foo

tball

Hoc

key

Cric

ket

Voll

eyb

all

Bas

ketb

all

Answer: (penalty regime: 0 %)

### Question 3

Correct

Marked out of 1.00

### Java HashMap Methods

[containsKey\(\)](#) Indicate if an entry with the specified key exists in the map

[containsValue\(\)](#) Indicate if an entry with the specified value exists in the map

[putIfAbsent\(\)](#) Write an entry into the map but only if an entry with

the same key does not already exist [remove\(\)](#) Remove an entry

from the map

replace() Write to an entry in the  
map only if it exists size() Return

the number of entries in the map

Your task is to fill the incomplete code to get desired output

Answer: (penalty regime: 0 %)

Question 1

Correct

Marked out of 5.00

Write a function that takes an input String (sentence) and generates a new String (modified sentence) by reversing the words in the original String, maintaining the words position.

In addition, the function should be able to control the reversing of the case (upper or lowercase) based on a case\_option parameter, as follows:

If case\_option = 0, normal reversal of words i.e., if the original sentence is " Wipro TechNologies BangaLore" , the new reversed sentence should be " orpiW seigoloNhceT eroLagnaB" .

If case\_option = 1, reversal of words with retaining position' s case i.e., if the original sentence is " Wipro TechNologies BangaLore" , the new reversed sentence should be " Orpiw SeigOlonhcet ErolaGnab" .

Note that positions 1, 7, 11, 20 and 25 in the original string are uppercase W, T, N, B and L. Similarly, positions 1, 7, 11, 20 and 25 in the new string are uppercase O, S, O, E and G. NOTE:

1. Only space character should be treated as the word separator i.e., " Hello World" should be treated as two separate words, " Hello" and " World" . However, " Hello,World" , " Hello;World" , " Hello- World" or " Hello/World" should be considered as a single word.
2. Non- alphabetic characters in the String should not be subjected to case changes. For example, if case option = 1 and the original sentence is " Wipro TechNologies,

Bangalore” the new reversed sentence should be “ Orpiw ,seiGolonhceT Erolagnab” .  
 Note that comma has been treated as part of the word “ Technologies,” and when comma had to take the position of uppercase T it remained as a comma and uppercase T took the position of comma. However, the words “ Wipro and Bangalore” have changed to “ Orpiw” and “ Erolagnab” .

3. Kindly ensure that no extra (additional) space characters are embedded within the resultant reversed String. Examples:

| S. No | input1                        | input2 | output                        |
|-------|-------------------------------|--------|-------------------------------|
| 1     | Wipro Technologies Bangalore  | 0      | orpiW seigolonhceT erolagnaB  |
| 2     | Wipro Technologies, Bangalore | 0      | orpiW ,seigolonhceT erolagnaB |
| 3     | Wipro Technologies Bangalore  | 1      | Orpiw SeigolonhceT Erolagnab  |
| 4     | Wipro Technologies, Bangalore | 1      | Orpiw ,seigolonhceT Erolagnab |

For example:

| Input                           | Result                        |
|---------------------------------|-------------------------------|
| Wipro Technologies Bangalore 0  | orpiW seigolonhceT erolagnaB  |
| Wipro Technologies, Bangalore 0 | orpiW ,seigolonhceT erolagnaB |
| Wipro Technologies Bangalore 1  | Orpiw SeigolonhceT Erolagnab  |
| Wipro Technologies, Bangalore 1 | Orpiw ,seigolonhceT Erolagnab |

Answer: (penalty regime: 0 %)

## Question 2

Correct

Marked out of 5.00

You are provided with a string which has a sequence of 1' s and 0' s.

This sequence is the encoded version of a English word. You are supposed write a program to decode the provided string and find the original word.

Each alphabet is represented

by a sequence of 0s. This is as

mentioned below:

Z : 0

Y : 00

X : 000

W : 0000

V : 00000

U : 000000

T : 0000000

and so on upto A having 26 0' s (000000000000000000000000000000).

The sequence of 0' s in the encoded form are separated by a single 1

which helps to distinguish between 2 letters. Example 1:

input1: 010010001

The decoded string

(original word) will be: ZYX

Example 2:

input1: 0000100000000000000000001000000000001000000000010000000000001

The decoded string (original word) will be: WIPRO

Note: The decoded string must always be in UPPER case.

For example:

| Input                                                             | Result |
|-------------------------------------------------------------------|--------|
| 010010001                                                         | ZYX    |
| 0000100000000000000000001000000<br>000001000000000100000000000001 | WIPRO  |

Answer: (penalty regime: 0 %)

```
1 import java.util.*;
 public class BinaryDecoder{
 public static void main(String[] args)
 {
2 Scanner sc=new
 Scanner(System.in);
 String
 encoded=sc.nextLine();
3 String[] sequences= encoded.split("1");
 StringBuilder decodedWord=new
4 StringBuilder(); for(String
 seq:sequences){
 if(!seq.isEmpty())
 {
5 int
 letterPos=seq.leng
6 th();
 if(letterPos<=26)
7 {
 char decodedChar=(char)('Z'- (letterPos- 1));
8 decodedW ord.append(decodedChar);
 }
9 }
 }
 System.out.println(decodedW ord.toString());
 }
 }
1 }
0
1
1
```

### Question 3

Correct

Marked out of 5.00

Given two char arrays input1[] and input2[] containing only lower case alphabets, extracts the alphabets which are present in both arrays (common alphabets).

Get the ASCII values of all the extracted alphabets.

Calculate sum of those ASCII values. Lets call it sum1 and calculate single digit sum of sum1, i.e., keep adding the digits of sum1 until you arrive at a single digit.

Return that single digit as output.

Note:

1. Array size ranges from 1 to 10.
2. All the array elements are lower case alphabets.
3. Atleast one common alphabet will be found in the arrays.

Example 1:

input1: { ' a' , ' b' , ' c' }

input2:

{ ' b' ,  
' c' }

output:

8

Explanat

ion:

' b' and ' c' are

present in both the

arrays. ASCII value of

' b' is 98 and ' c' is

99.

$98 + 99 = 197$

$$1 + 9 + 7 = 17$$

$$1 + 7 = 8$$

For example:

| In<br>p<br>ut | Re<br>sul<br>t |
|---------------|----------------|
|               | 8              |

Answer: (penalty regime: 0 %)
